VOICE SABER

Attacking Virtual Voice Assistants Using Laser

Project ID 2112

1 ABSTRACT

Voice Saber is a project in which we are exploiting a vulnerability that exists in MEMS microphone which allows us to remotely execute commands using laser.
Alongside the attack case we also created a framework to patch this vulnerability.

OBJECTIVES 2

Two main objective, first of them being the attack case in which we made the whole attack circuit as cheap as possible.
In the second phase we created a framework which recognizes the voice coming into the mic and decides weather this is an attack or
